

Problem Set 1

To try these problems, download [decaboard.py](#) and [start.py](#) to your computer, and then run `python start.py`.

For each problem, write an `angleIt` function that draws the picture. The number returned by `angleIt` is the angle (in degrees) that the square will be rotated around its center.

For instance, to draw this:

You would write this (see [start.py](#)):

```
# start.py

import decaboard

def angleIt(row, col, elapsed_seconds):
    return 0

decaboard.run_board(angleIt)
```

You can control where the window opens by passing in the location of where to put the window, e.g. `decaboard.run_board(angleIt, 1400, 200)` opens the window at (1400, 200) near the right top side of the screen.

You can answer each question with its own `.py` file. Or, you can put all your answers into `start.py`, naming them `angleIt1`, `angleIt2`, etc. Then pass the function you want to use to `decaboard.run_board`.

Problem 1

What code draws this?
